LIFE WITH DENTURES

Healthy teeth play an important role in our general health and wellbeing. There are many reasons why people lose their teeth, which can have a strong impact on your quality of life. Missing teeth can cause bone loss and the jaw bone to shrink this is because bone is no longer stimulated when you chew your food. This also causes physical changes to your face, your jaw line shrinks causing dentures to lose their fit, often slipping and causing pain on your lower jaw especially.

Uncomfortable dentures can make it difficult to chew and eat the foods you like to enjoy, ill-fitting dentures can also impact on your speech.

If this is your problem, then modern dental implant-based dentures are the solution. This can dramatically improve the quality of your life, such as enabling proper eating wider variety of the foods you want to enjoy, speaking, increasing your comfort and self-confidence, ask your dental professional for the solution that is right for you.

REMOVABLE IMPLANT OVERDENTURES

These provide stability were your new dentures are attached to two or more dental implants making this a cost-effective option. Your new teeth can be removed for cleaning and the need for denture adhesive can be eliminated.

REMOVABLE OVERDENTURES ON AN IMPLANT BAR

For an even more secure fit, a dental bar is fixed to your jaw bone with two or more implants, providing stronger support for your new

removable dentures.

FIXED IMPLANT SUPPORTED BRIDGES / DENTURES

These are a more durable solution, secured on four or more dental implants. This solution stimulates bone maintenance, restores chewing function.

DENTAL IMPLANTS OFFER MANY ADVANTAGES

Dental implants are accepted by dental professionals for over forty years, as the most successful and trusted method of teeth replacement. Act like your natural tooth root, you cannot feel the difference.

Are made of biocompatible materials, as a result they are accepted by your body.

Implant will normally last a lifetime with proper care and good oral hygiene.

They maintain natural bone, and minimise further bone loss due to bone stimulation, this is one of their most important advantages.

Provide stability and comfort for a wide variety of replacement solutions.
